

DERMABRASION Professional

DERMABRASION Digital

Timeless time

Though it isn't easy to put the clock back, we attempt to do it. During the last years it has been proved with profound medical researches that the recurring intra-epidermal injury caused by microdermabrasion provokes gradual improvement in the condition of the skin by stimulating of the proliferation of fibroblasts and the production of collagen. Rajan and his workmates, Lee and his team, and Song and his colleagues published various studies in renowned dermatological journals during the last few years that had proved the intensive effects of microdermabrasion. These objective evidences are the basis of our developments.

Sand in the wind

Microdermabrasion utilises the cleaning, improving skin breathing and regenerating effects of controlled mechanical peeling in repairing the imperfections of the skin. The essence of the treatment is that a special handpiece makes aluminium-oxide crystals to flow above the skin with the help of vacuum or compressed air, and they carry the dead horny cells away. Used crystals with the impurities together are returned into the device through a pipe, and are collected in a tank. As an effect of the treatment, minor imperfections of the skin go through visible changes: reduced depth of wrinkles and smoother skin surface.

Without wrinkles

Microdermabrasion rubs off the thickened skin around the wrinkles and stimulates the tissues in the heart of the wrinkles, reducing the depth of aesthetically disadvantageous lines and the irregularities of the skin surface in this way. The SENSITIVE treatment program of the dermabrasion device can treat the superficial lines and wrinkles with the meanest damaging of the skin.

The integrated VACUCONTROL® automatics maintains the sucking power at a constant level, thus reddening, haemorrhage and other permanent abnormalities may be prevented during the treatment. The DEEP LINES treatment program has been designed for the intensive treatment of deeper wrinkles: this program has the most successful rejuvenation effect. Unique results could be achieved with the application of the Arcelox products with botox-effect or the Caviar treatment line from Jean d'Arce. Spectacular rejuvenation could be carried out with the gentle, marine-originated AHA products and the new Enzymarine mask from Thal'ion.

Deserves love

The Dermabrasion Digital abounds in the newest technical developments: it is full-scale programmable and controlled with push-buttons, has automatic cleaning and anti-blockage system, and an ultrasound module can be integrated in it. The entirely digital control makes the use of the device to be really safety, reducing the possibilities of failed function to a minimum level. Dermabrasion Digital seems to be like a new family car: fascinating design, reliable function comfortable and safety use.

Drunk with success

Our high-tech device, the Dermabrasion Professional has been designed for those demanding specialists that aren't willing to make compromises. This digitally controlled device with two compressors is unique in its category, makes possible to control separately the flow of crystals and the vacuum, thus it is adequate to treat even the most sensitive skin as well. We have a plenty of satisfied partners because of the auto cleaning system providing continuous function and the pre-heating of crystals preventing the crystals from getting stuck together. In addition to the lots of services, the aperture for the filling and removal of crystals counts only as a little courtesy, with which you could save money and time even in the busiest beauty salons.

Laser, ultrasound, microdermabrasion

The bio-stimulation with laser fills up the energy reservoirs of the tired, aging skin, thus preparing the fissiparous cells to replace those of the skin surface rubbed off with microdermabrasion in the shortest time possible. The laser stimulates significantly the quick healing of the damaged skin surface and the fast reducing of oedema created during the treatment.

Due to the laser, the aging skin reacts to the superficial injuries caused by microdermabrasion as a young skin able to regenerate quickly. This completes the regenerating process triggered by microdermabrasion. The threefold effect of the laser therapy holds out complex advantageous for skin with acne: the bio-stimulation helps the scars to heal and the waste materials to remove; the pain-relieving effect reduces the subjective inconveniences, and the anti-inflammatory effect is beneficial for the inflamed nodules evolving during that the acne is present. The ultrasound used simultaneously improves the regeneration of collagen fibres, thus helps healing without scars. The ultrasound looses up the comedos, therefore makes the cleaning of the skin to be easier, and increases the absorption ability of the skin, thus makes the active ingredients applied during the treatment to penetrate deeper.

As a result of these facts, the synergy of laser and ultrasound has such beneficial effects that haven't been experienced till now and results in the spectacular improvement in the condition of skin with acne.
